

ABSTRACT OF THE DISCLOSURE

Disposable, water resistant covers having a pair of resilient bands at each open end, and an absorbent medium disposed between the pair of resilient bands. The bands provide a substantially watertight seal between the cover and the users skin surface. The absorbent medium prevents any moisture that manages to bypass one band to reach the other band. The covers are formed to cover any medical application such as bandages, casts, splints, etc., on a patient's head, neck, chest, waist, arms, legs, and feet to protect against water seepage when attending to regular personal hygiene.
